Innovations in Equine Care

If you own a horse, then you need The Original Mowl.

The Original Mowl is a complete feeding system that allows your domestic equine to feed in a natural grazing position. It helps protect against sand colic and will enhance the health and longevity of your horse just by incorporating it into its daily feeding ritual. It will also save you money on supplements and feed.

Equine care professionals agree and recommend that you ground feed your horse in its natural grazing position. It conditions and promotes the stretching and strengthening of the jaw, neck, back and leg muscles for sound bio-mechanics and balance. It also helps to maintain the proper alignment of the incisors, molars and TMJ. All of which are critical to the overall health, development and performance of your horse. Whereas, chest level feeders require your horse to be in an unnatural feeding position that can compromise all of the above in addition to causing uneven tooth wear, improper chewing, decreased saliva, misalignment of the jaw or irregularities to the digestive system.

Another major benefit of the Mowl is that it helps prevent sand colic which occurs in 1 out of 10 horses. Inevitably, horses will pull their feed out of chest level feeders and eat off the ground which increases the likelihood of ingesting sand or dirt. The Mowl will not move, flip, tip or spill and keeps all of the supplements and feed in the bowl.

The Original Mowl is a complete feeding system for your horse. It is the only feeder you should be using and it will give you the confidence in knowing that you are caring for your horse with the best method of feeding available today.

Equine Originals, 2005

A Complete Feeding System for your Domestic Equine.

- **Promotes a natural grazing position.**
- **Stretches and strengthens the jaw, neck, back and leg muscles.**
